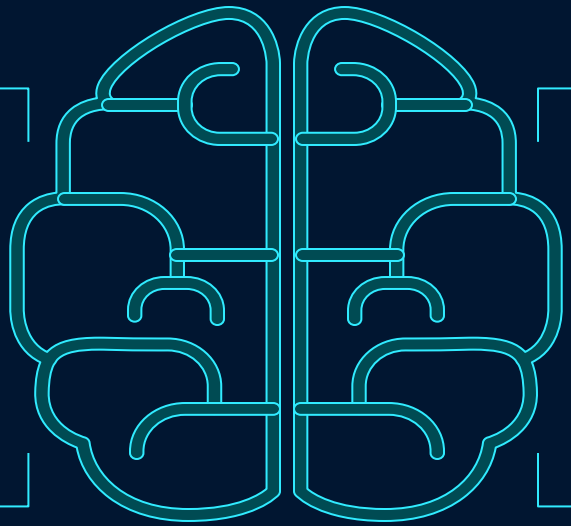
05 Level Analysis

"知彼知己 百戰百勝"

the best defense starts with understanding the attacker

The Art of War by Sun Tzu

01. Educational Objectives



Attacker-centric

Learn first-hand the logical flow of cyberattacks via simulated hacking mechanisms.

Master concepts

Gain intuitive understanding of core cybersecurity principles via interactive simulations.

Defender-centric

Enrich Incident Response skills via asset prioritizing & mitigation deployment tasks.

Strengthen IT governance

Foster a managerial mindset via evaluative & policy application exercises.

02. Key Concepts

Hash Password
Converts a password into a non-reversible, fixed-length string for secure storage

Dictionary Attack
Tries common words and passwords to guess a user's password

Social Engineering
Manipulates people into revealing sensitive information

Domain Spoofing
Imitates a trusted domain to deceive users

Phishing
Uses fake emails or websites to steal personal data

Trojan
Malware disguised as legitimate software

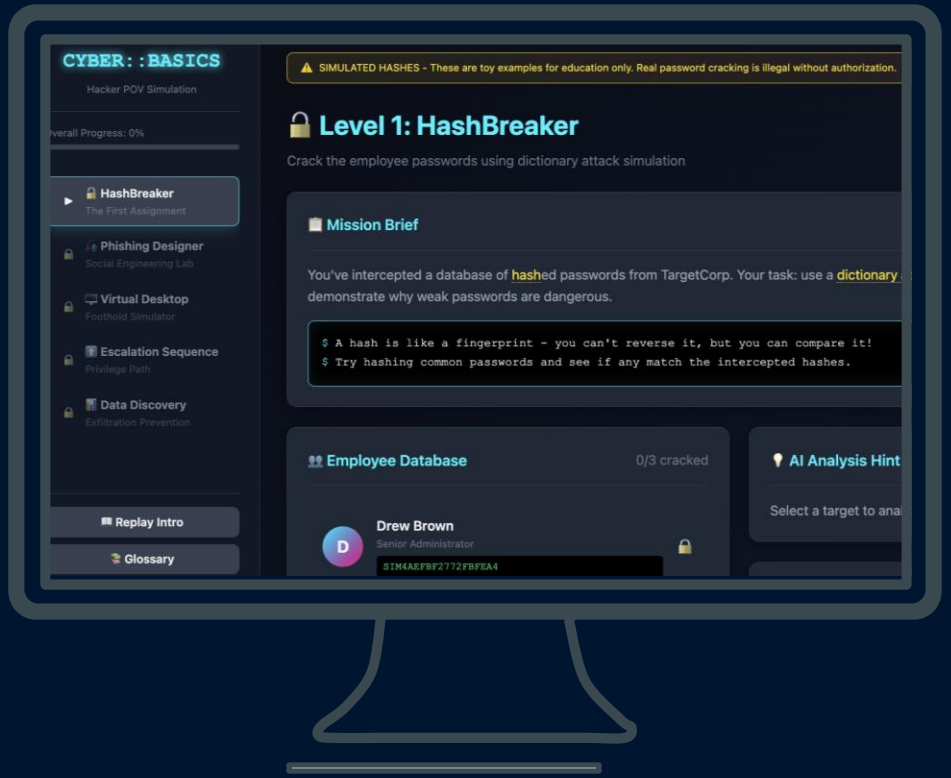
Backdoor
A hidden access point that bypasses authentication

Privilege Escalation
Gaining higher access rights without authorization

Keylogger
Records keystrokes to capture sensitive information

Data Exfiltration
Unauthorized transfer of data outside a network

Logging & Monitoring
Collecting and analyzing system activity to detect security threats



03.
Game Overview

A web-based interactive simulation consisting of 5 missions designed to experience the core principles of cyber-attack and defense.

04.
Play Game!

Please open the link on your **Laptop**!

05. Level Analysis

Level 1 -
Hash Breaker

Weak passwords are cracked by **matching leaked hashes** with a small dictionary of **common passwords.**

Level 2 –
Phishing Designer

Suspicious emails are identified by analyzing **sender details, urgency cues,** and **misleading links.**

Level 3 –
Virtual Desktop Infection

Malware access is achieved by **opening a disguised file** that installs a **Trojan** and **backdoor.**

Level 4 –
Privilege Escalation

Administrator access is completed by **deploying a keylogger, bypassing filters, capturing admin credentials,** and **exfiltrating data.**

Level 5 –
Data Discovery

Sensitive data exposure is assessed to understand the **business impact** and **exposure scope.**

Thank You !
